BOOK REVIEWS

American librarians, harried by heavy work loads and influenced by their educational backgrounds (humanities), have consistently chosen to rely on intuition and tradition as the best avenues to sound library management. The last several decades, however, have ushered in a library scene at once so mammoth and complex that most contemporary administrators are beginning to doubt the efficacy of intuition, habit, and tradition as guides to library management. Most librarians now appear to view “research” as an essential ingredient in the library administration formula.

This growing interest in “research”—and few agree on the definition of that term—is illustrated by the establishment and concomitant popularity of the Library Research Round Table of ALA. Further evidence of this new interest can be found in the appearance of a number of works designed to facilitate research in library science.

Most of these works, such as the Bundy and Wasserman *Reader in Research Methods* and Goldhor’s *Introduction to Scientific Research in Librarianship* fell considerably short of their promise. Others like Bob Lee’s *Research in Librarianship: Course Outline and Bibliography* proved to be useful and inexpensive guides to the literature. But, we still stand in need of an adequate guide to research methods in library science.

Most of these works, such as the Bundy and Wasserman *Reader in Research Methods* and Goldhor’s *Introduction to Scientific Research in Librarianship* fell considerably short of their promise. Others like Bob Lee’s *Research in Librarianship: Course Outline and Bibliography* proved to be useful and inexpensive guides to the literature. But, we still stand in need of an adequate guide to research methods in library science.

Bohdan Wynar’s *Research Methods in Library Science* will not answer that need. Indeed, Wynar’s book is poorly conceived and haphazardly executed. The book is in reality the compiler’s course outline and bibliography for a research course taught over the years in various library schools. The topical outlines are so brief as to be useless, and the 700-odd items cited are neither the best works nor the most representative in their respective categories, i.e., history, experimental studies, surveys, content analysis, etc. For instance, in the history section, the compiler cites several papers by Laurel Grotzinger while neglecting to note her excellent book length study on Katherine Anne Sharp, and he omits any reference at all to the important work of Haynes McMullen on nineteenth-century American libraries. These oversights could be duplicated in each section of the book. Wynar also appends brief annotations to about half of the works cited—annotations which are descriptive in nature and in many cases hardly justify the effort—i.e., “This is a good historical survey,” or “a well documented work.”

Who could make use of such a book? Certainly not the professional librarian whose need is for a guide to methods rather than the literature. After having taught research methods for a number of years I also doubt whether this book would be of any real value to the master’s candidate in library science. The errors of omission and commission are numerous enough to make the bibliographies misleading. But, library school faculty will probably find an occasional item unknown to them, and perhaps the Ph.D. candidate studying for his qualifying exams might benefit from a survey of its contents.

One wonders how a book so poorly planned and executed and with such a limited audience could justify publication in hard cover at a price of $8.50. Perhaps the fact that the compiler is president of Libraries Unlimited, Inc., is explanation enough.—Michael H. Harris, College of Library Science, University of Kentucky, Lexington.

Ten librarians contributed to this volume, edited by Jerrold Orne, as a token of professional respect for Robert B. Downs.
upon his retirement as dean of library administration at the University of Illinois.

Downs has been one of the leading protagonists in the drama of research library development for more than four decades, as attested to by the positions he has held, his list of publications (compiled in this volume by Clarabelle Gunning), professional committee assignments, and by the demands for his services as consultant, nationally and internationally. When this man’s career is viewed in totality, it is difficult to avoid the use of such words as “giant,” “committed,” and “tenacious.” He has devoted his talent and energy to the library profession since 1929.

The essays in Research Librarianship, preceded by a short biography by Robert F. Delzell, have been selected to demonstrate the wide range of Downs’ interests and contributions: intellectual freedom, academic status for librarians, interlibrary cooperation, library resources and bibliography, collection building and rare books, library education, and library surveys. These seven chapters appearing in the order given were contributed by Everett T. Moore, Arthur M. McAnally, Robert H. Blackburn, William V. Jackson, Robert Vosper, and Jack Dalton. The concluding chapter was written jointly by Stephen A. McCarthy and Murray L. Howder.

These essays are far from a potpourri hastily thrown together as a gesture to a retiring colleague. They represent a distillation of contemporary thought on topics of essential and current concern to research librarianship. The contributors are knowledgeable and articulate librarians.

Everett Moore has described an important episode in the struggle for intellectual freedom, namely, the fright and furor generated by the witch hunt of Senator Joseph R. McCarthy in the fifties; also the counter-attack launched by the book and library professions which led to the “Freedom to Read” statement and its endorsement by ALA.

The essay by Arthur McAnally on “Status of the University Librarian in the Academic Community” is a topic of continuing concern to the profession. He traces the evolution of the movement for academic status and summarizes current developments. Using as examples those few libraries where librarians attempt governances constituted as a faculty, McAnally suggests that the following pattern may evolve in large university libraries in the near future: rotating department heads, a special policy which will permit subject specialists to advance in rank and salary at the same pace as the library administrator, academic freedom and tenure, peer evaluation before appointment, a clearly defined promotion system, a workweek defined only in terms of getting the work done, no quotas for the various academic ranks, and opportunity for continuing education and professional growth (“... a suitable workweek, nine-month contracts or educational leave with pay, and sabbatical leaves.”).

Robert H. Blackburn discussed interlibrary cooperation under four general headings: physical access, bibliographic access, acquisition, and administration. Using these topics as a broad avenue of approach enabled him to comment briefly on most of the cooperative efforts in North America, Western Europe, and the United Kingdom which seem viable. William Jackson described the various types of published guides to resources—national, regional, state, and local—and evaluated their scope and usefulness.

Robert Vosper observed the rapid growth in size and quality of university libraries, and mentioned the various methods used by select libraries to effect this growth. He concluded with a sober, not unduly pessimistic, statement on future prospects for continued growth and with his belief that national involvement is the hope for the next decade.

Jack Dalton wrote on the state of library education, or rather, by his own admission, reflected and asked questions for which he hoped there might be answers in the future. He ended with an exhortation for critical self-examination which may bring revolutionary changes in library education.

Using the publications of Downs relating to resources, catalogs, cataloging, surveys, individual libraries, and groups of libraries, Stephen McCarthy and Murray Howder appraise these as part of the literature of librarianship in the United States today; also, they estimate their value in
focusing attention upon problems which have beset college and university libraries. The authors believe that the general university library survey will be used less frequently in the future.

It must indeed be gratifying to Robert Downs to have such a volume appear in his honor! All the essays contain useful appended bibliographies.

This reviewer was shocked at the price of the book, which seems exorbitant—$11.95 in the USA and Canada, and $13.15 elsewhere. While the volume is attractive and pleasing in format, the design and production posed no special problems to justify such cost.—Cecil K. Byrd, Indiana University, Bloomington.

This supplement completes and extends the earlier volume which has long since become a necessary reference tool in a great number of libraries and private collections. The basic work, which appeared in 1968, included imprints through 1965. The supplement covers the years 1965-1969. It also includes 432 citations for material previous to 1965 and for which data were not available for inclusion in the earlier volume. In addition sixty-four additional bibliographic journals are cited.

The arrangement is the same in the supplement as in the basic work. Groupings are by subject with geographical subdivisions when necessary (e.g., Literature—Colombia). The sources for the bibliographical information are given unless the material was available at the Columbus Memorial Library or at the Library of Congress. This is a particularly important feature because it indicates where many of the hard to locate items might be available.

The work is not exhaustive. Basically it includes selected citations from forty of the principal bibliographical sources, plus bibliographic data on items received by the Columbus Memorial Library and Library of Congress. Nevertheless it is a handy compilation and includes many items that would be almost impossible to find elsewhere.

Apparently the author's policy has been to include any separately published item whether it be a book or pamphlet. Periodical items are not included nor unfortunately the many fine bibliographical papers presented at the SALALM meetings. Perhaps a future edition might indicate the guidelines for inclusion plus covering the SALALM papers which are seldom covered in any bibliography.

Apart from a few small typographical and indexing errors, this book is an attractive, well-done, and much needed ready reference source. As such, it should be on the shelves of all college and research libraries along with Geoghegan, Handbook of Latin American Studies, and Latin American Research Review.—John G. Veenstra, School of Library Service, Columbia University.

The volume contains reprints of nineteen articles that, according to the introduction, “are relatively easy to read for beginning students” and “are likely to be useful for a number of years.” The ASIS Education Committee selected the titles in this volume of readings designed for use in introductory information science courses. Although the contents of the volume as a whole, combined with an instructor’s guidance for evaluation, will be useful to students, it will also be useful to those librarians who are true professionals and continue to learn long after their years of formal education.

The volume is organized into three subject areas—“Background and History,” “Information Needs and Systems,” and “Organization and Dissemination of Information,” and concludes with “Other Areas of Interest.” As seems to be inevitable, the headings of the subject areas include more than the subjects contained. The most satisfactory and best integrated section is “Organization and Dissemination of Information” which embraces six articles, five of which are classical papers on automatic abstracting and indexing, and on selective dissemination of information. The five papers under “Information Needs and Sys-
