
This review of 200 research collections from 40 publishers should prove very useful to research libraries, both as a selection tool and as a guide to the contents, organization, and use of specific microform collections held by the library. Selection was made on the basis of general usefulness. Size and complexity, timeliness of subject matter, the availability of reviews, and ownership by many libraries favored inclusion. An attempt was made to achieve a broad coverage of subject areas and to include collections of similar content for the sake of comparison.

The editor chose not to evaluate the collections.

Entries are arranged alphabetically by title, listing publisher, date, format, price, and review citations. Under each entry there is a detailed description of arrangement and bibliographic control and a listing of bibliographies, indexes, and other related materials. Scope and content notes were taken primarily from publishers' brochures and statements but sometimes from a review or the bibliography forming the basis of the collection. Those without citation, which presumably were written by the editor, are informative and concise, but the quality of the others varies considerably. Many are verbose; condensation would increase convenience of consultation. It would have been helpful to have the title of the collection under review as a page heading rather than the title of the guide.

The dictionary index gives extensive and excellent page references to all the bibliographic citations from variant titles and names associated with them. Omitting subtitles and other descriptive matter would make it more concise. References from variant titles and added entries are in see reference form to other entries in the index, instead of giving the page in the body of the work. This often results in an unnecessary two-step look up. The same is true for subjects: e.g., "Funnies see Comic books, strips, etc." instead of "Funnies—Canadian, 61" (the only entry under comic books being "—Canadian").

There are also inconsistencies, e.g., "Holland see Dutch literature: Europe—but no entry under Netherlands and none under other European countries referring to Europe. Many subject entries are of an analytic nature. There are references from "Anthropology," "Fisheries," "Mycology," and many other subjects to the U.S. depository government publications. A separate subject index would have permitted rapid overview and spotting of these repetitious analytic entries.

Price information is up to date as of June 1976, while reference to reviews is current to the fall of 1977. Some caution is advised. Dodson lists Documents on Contemporary China, 1949-1975 as ca. 4,000 microfiche, issued in six sections at $5,850. The only indication that the information may be tentative are two sentences: "Each section . . . will have its own bibliography/index. When the collection is complete these sections will be combined into one entity." The same collection, reviewed in Microform Review (v.7, no.2 [March/April 1978]) is quoted at $4,800 for 525 microfiche issued in five sec-
tions. The guide itself is advertised at $35 while Books in Print 1977/78 quotes a price of $17.50. At the latter price it should be in every research library.

Bibliotherapy is “a program of activity based on the interactive processes of the use of print and nonprint materials whether imaginative or informational, facilitated by a librarian or other professional, to achieve insight into normal development or to effect changes in emotionally disturbed behavior,” according to the author.

In Using Bibliotherapy: A Guide to Theory and Practice Rhea Joyce Rubin traces the development of this adjunct therapy in the United States. During a typical session the bibliotherapist presents the material to a group or to an individual, hoping that identification with a remote character and projection leading to catharsis will occur. Essential to the process is discussion on a personal level, an avenue for the client’s insight into the solution of his or her own problems. The differences between bibliotherapy and the newer poetry therapy are enumerated. Both have proved beneficial in hospitals, correctional institutions, educational environments, and community settings.

Success for bibliotherapists seems to depend more on personal qualities such as emotional stability and the ability to relate well with people than on academic back-
