Book Reviews

The percentage of the total university budget allocated to the library has been dropping in recent years. At its highest level, the library’s share at most schools never exceeded five or six percent. In the late 1990s, it is closer to three percent. In The Academic Library, John Budd devotes an entire chapter to “Libraries and Money.” He does an excellent job in couching this discussion of library funding in its larger institutional context. Budd does the profession, and particularly SLIS students, a distinct service by presenting the academic library in this perspective—one that is not often expressed, much less emphasized.

The various “cultures” of higher education, including those of students, administrators, faculty, and trustees, are each examined by Budd. He explores their impact on each other and their effects on the library. In addition, he discusses the various forces currently shaping the university within the context of the forces that have changed higher education in the past. Using a familiar example, he reflects on the arguments of Allan Bloom in The Closing of the American Mind: What in the academy prompts this kind of work? What effect does such thinking have on the academic library and the role of the library in shaping the canon in higher education?

A number of pages are devoted to the manner in which decisions, at all levels of the university and which affect the library, are made. Budd first addresses the culture of complex organizations and the principles of their management. The university, of which the library is a functional unit, is composed of multiple unequal “subcultures.” Naturally, the faculty and the administration are major players here and Budd looks at the interplay of these parties in his analysis. The library—structurally analogous to a department or college—is itself a subculture affected by the interactions of the various parts within the institution.

This work scrutinizes the evolution of management and governance of the university and the library. In attempting to understand the structure of decision-making, Budd is able to add detail to the models he discusses in the preceding chapter on organizational structure. He considers the respective roles of the president, board, and faculty, and how campus finances influence their interrelations. Budd lays open, for the student, the processes of policy-making in the university and explains how they affect the library.

There follow chapters on the collection itself, electronic resources, library instruction, and the roles librarians play. The Academic Library is designed to be a textbook, with potential discussion questions included at the end of each chapter. Also included with each chapter are extensive bibliographies, facilitating further exploration of the topics presented. The sole appendix is the LSU Library Faculty Policy Statement.

Budd does a superb job of walking the line between theory and practice; the reader who worries that a library school professor would have difficulty describing the way things are done in the field will be comforted by this book. He has produced a work seemingly without prejudice toward a particular type of academic library, for he considers issues affecting the full spectrum of academic libraries from those at community colleges to those of research institutions. In fact, it
is difficult to identify his personal biases on many difficult and controversial topics. Budd has a good command of his subject matter and presents it in a cohesive manner. He is to be commended and his book recommended. —Clay Williams, Ferris State University, Big Rapids, Michigan.

This is an odd book. It consists of the papers delivered, in English, at the 1996 conference in Tokyo and the discussions following the two all-day sessions. The conference was organized by the staff of Kunitachi College of Music, the publishing company Kinokuniya, and OCLC Online Computer Library Center, with financial support from The Japan Foundation Center for Global Partnership. The first 117 pages of the book consist of translations into Japanese of both the papers and the discussions, making them available to both Japanese and English readers.

Several names well known to American librarians are among the presenters, including Andrew Wang and Phyllis B. Spies, OCLC; Steven Hall, Chadwyck-Healey; and Mary Kay Duggan, U.C.-Berkeley’s School of Information Management. Less well known to Americans are the editor of this work, Matsushita Hitoshi, acting librarian of the Kunitachi College of Music Library; presenter Min-min Chang, director of the Library of Hong Kong University of Science and Technology; and discussant Abe Shin’ichi, head of the Medical Information Center for Education and Research at Jikei University’s School of Medicine.

Papers delivered at the conference cover a wide range of issues relating to the theme of the conference and present a great deal of useful information in one place. Spies’s paper, “International Library Cooperation in the Age of Electronic Information: Recent Trends and OCLC’s Role,” illustrates how developments in electronic information reflect changes in the global market and how OCLC reacts to those changes as they impact the “emerging global library community.” She states that “[f]urthering access to the world’s information and reducing the cost of that information remain OCLC’s major public purposes.”

The University of Pittsburgh’s Arlene G. Taylor’s paper, “The Electronic Information Environment and Academic Libraries in the U.S.,” focuses on such concerns as what is to be included in a library catalog, what should be in a catalog record, the international coding of records for machine manipulation, new concepts in authority control, and challenges of multiple-language subject approaches. She addresses the efforts of the International Federation of Library Associations (IFLA) in the transnational exchange of authority data and the progress multilingual nations, such as Singapore and Canada, have made in multiple-language subject control, and notes that some public libraries in the United States provide both English and Spanish access to their subject catalogs. A recurring theme in Taylor’s paper is disappearing boundaries, a gradual removal of the limitations librarians have confronted in catalogs, authority control, subject access, etc. She concludes with the view that: “Disappearing boundaries are and always have been a challenge. Too often we’ve dealt with them in the past by building fences to delineate the perceived positions of the boundaries. In the libraries and cataloging it is time to take down the fences.”

In his paper, “The Future of Electronic Information Services in Libraries,” OCLC’s Rick Noble outlines the recent history of electronic information services, which “began to appear in North American libraries about twenty-five years ago.” He goes on to show how developments in the Internet and the World Wide
